

# SMART CONTRACT CODE REVIEW AND SECURITY ANALYSIS REPORT

Customer: Furucombo

Date: April 1st, 2021

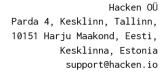

This document may contain confidential information about IT systems and the intellectual property of the Customer as well as information about potential vulnerabilities and methods of their exploitation.

The report containing confidential information can be used internally by the Customer, or it can be disclosed publicly after all vulnerabilities are fixed - upon a decision of the Customer.

#### **Document**

Name	Smart Contract Code Review and Security Analysis Report for Furucombo RCOMBO - Initial Audit		
Approved by	Andrew Matiukhin   CTO Hacken OU		
Туре	Token, Token Swap		
Platform	Ethereum / Solidity		
Methods	Architecture Review, Functional Testing, Computer-Aided Verification, Manual Review		
Git	https://github.com/dinngodev/RCOMBO commit 6d3d04f8a3a833ff60edab274202de2c88659ca0.		
Timeline	30 March 2021 - 1 April 2021		
Changelog	1 APRIL 2021 - INITIAL AUDIT		

# **Table of contents**

Introduction	4	
Scope	4	
Executive Summary	5	
Severity Definitions	6	
AS-IS overview	7	
Conclusion	8	
Disclaimers	9	

## Introduction

Hacken  $O\ddot{U}$  (Consultant) was contracted by Furucombo (Customer) to conduct a Smart Contract Code Review and Security Analysis. This report presents the findings of the security assessment of Customer's smart contract and its code review conducted on April 1<sup>st</sup>, 2021.

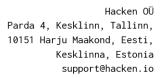

## Scope

The scope of the project is smart contracts in the provided Git Repository:

https://github.com/dinngodev/RCOMBO
commit 6d3d04f8a3a833ff60edab274202de2c88659ca0.
contracts/hegic/GradualTokenSwap/contracts/GradualTokenSwap.sol
contracts/RCOMBO.sol
contracts/Migrations.sol
contracts/hegic/GradualTokenSwap/contracts/ERC20Recovery.sol

We have scanned this smart contract for commonly known and more specific vulnerabilities. Here are some of the commonly known vulnerabilities that are considered:

Category	Check Item
Code review	Reentrancy
	<ul><li>Ownership Takeover</li></ul>
	<ul><li>Timestamp Dependence</li></ul>
	<ul><li>Gas Limit and Loops</li></ul>
	<ul><li>DoS with (Unexpected) Throw</li></ul>
	<ul><li>DoS with Block Gas Limit</li></ul>
	<ul> <li>Transaction-Ordering Dependence</li> </ul>
	Style guide violation
	<ul><li>Costly Loop</li></ul>
	<ul><li>ERC20 API violation</li></ul>
	<ul><li>Unchecked external call</li></ul>
	<ul><li>Unchecked math</li></ul>
	<ul><li>Unsafe type inference</li></ul>
	<ul><li>Implicit visibility level</li></ul>
	<ul><li>Deployment Consistency</li></ul>
	<ul><li>Repository Consistency</li></ul>
	<ul><li>Data Consistency</li></ul>

#### Functional review

- Business Logics Review
- Functionality Checks
- Access Control & Authorization
- Escrow manipulation
- Token Supply manipulation
- Asset's integrity
- User Balances manipulation
- Kill-Switch Mechanism
- Operation Trails & Event Generation

## **Executive Summary**

According to the assessment, the Customer's smart contract is well-secured.

Insecure	Poor secured	Secured	Well-secured
		You are here	

Our team performed an analysis of code functionality, manual audit, and automated checks with Mythril and Slither. All issues found during automated analysis were manually reviewed, and important vulnerabilities are presented in the Audit overview section. A general overview is presented in AS-IS section, and all found issues can be found in the Audit overview section.

Security engineers found 1 informational issue during the first review.

Graph 1. The distribution of vulnerabilities after the first review.

# **Severity Definitions**

Risk Level	Description	
Critical	Critical vulnerabilities are usually straightforward to exploit and can lead to assets loss or data manipulations.	
High	High-level vulnerabilities are difficult to exploit; however, they also have a significant impact on smart contract execution, e.g., public access to crucial functions	
Medium	Medium-level vulnerabilities are important to fix; however, they can't lead to assets loss or data manipulations.	
Low	Low-level vulnerabilities are mostly related to outdated, unused, etc. code snippets that can't have a significant impact on execution	
Lowest / Code	Lowest-level vulnerabilities, code style violations,	
Style / Best	and info statements can't affect smart contract	
Practice	execution and can be ignored.	

## **Audit overview**

## ■■■ Critical

No Critical severity issues were found

#### High

No High severity issues were found

#### ■ Medium

No Medium severity issues were found

## Lowest / Code style / Best Practice

1. **Vulnerability:** Conformance to Solidity naming conventions

Contract: GradualTokenSwap

Solidity defines a <u>naming convention</u> that should be followed.

**On lines**: #20-21

IERC20 public immutable rCOMBO
IERC20 public immutable COMBO;

## Conclusion

Smart contracts within the scope were manually reviewed and analyzed with static analysis tools. For the contract, high-level description of functionality was presented in As-Is overview section of the report.

Audit report contains all found security vulnerabilities and other issues in the reviewed code.

Security engineers found 1 informational issue during the first review.

Category	Check Items	Comments
→ Code Review	→ Style guide violation	→ Conformance to Solidity naming conventions

#### **Disclaimers**

#### Hacken Disclaimer

The smart contracts given for audit have been analyzed in accordance with the best industry practices at the date of this report, in relation to cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report (Source Code); the Source Code compilation, deployment, and functionality (performing the intended functions).

The audit makes no statements or warranties on security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bugfree status or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only - we recommend proceeding with several independent audits and a public bug bounty program to ensure security of smart contracts.

#### **Technical Disclaimer**

Smart contracts are deployed and executed on blockchain platform. The platform, its programming language, and other software related to the smart contract can have its vulnerabilities that can lead to hacks. Thus, the audit can't guarantee the explicit security of the audited smart contracts.
